

[Feature name]

[One sentence: what changes for whom, and why.]

Field	Value
Document ID	[e.g. SRS-0001]
Version	[0.1]
Status	[Draft / In review / Approved]
Author	[Name, role]
Reviewers	[Names, roles]
Approval deadline	[Date]
Product version	[Release it targets]
Related tickets	[Epic, story or change request IDs]

How to use this template

Replace every [bracketed] value. Delete the grey italic guidance before the document goes out.

Keep the IDs (FR, NFR, BR, AC). Tickets, tests and the traceability matrix point back to them.

Delete sections that do not apply, and say so in the scope section so reviewers know it was deliberate.

Template by Nikola Djurovic, freelance Senior Business Analyst. Free to use and adapt. nikoladjurovic.cv

Change history

Version	Date	Author	Change
0.1	[Date]	[Name]	First draft

1. Requirements

1.1 Problem statement

Who is affected, what happens today, and what it costs. Two or three short paragraphs. Finish with the gap: the one thing the system does not do. A reader who stops here should know why the work matters.

[Problem statement]

1.2 Scope

In scope:

- [What this document changes]

Out of scope:

- [What it deliberately leaves alone, and where that is covered]

1.3 User scenarios

Three to five concrete scenarios with real values. Include one where the new control must let a legitimate case through, and one where data is missing or late. Each scenario should be testable later as an acceptance criterion.

Scenario 1. [Title]

[Who does what, with which values, and what happens today.]

Scenario 2. [Title]

[...]

1.4 Functional requirements

One testable statement per row, written about the system or a named actor. Prioritise with MoSCoW. If a requirement needs "and", it is probably two rows.

ID	Requirement	Priority	Source
FR-01	[The system stores ... when ...]	[Must]	[Stakeholder or ticket]
FR-02	[A user with ... can ...]	[Should]	
FR-03			

1.5 Non-functional requirements

Give each one a measure someone can check: a time, a volume, a percentage, a retention period.

ID	Requirement	Measure
NFR-01	[Performance: ...]	[e.g. under 10% extra runtime at 1,000 records]
NFR-02	[Auditability: ...]	[e.g. user, timestamp, reason retained 12 months]
NFR-03	[Accessibility: ...]	[e.g. state readable without colour]

1.6 Assumptions and dependencies

1. [Assumption the design relies on, and who confirmed it]
2. [System, team or decision this depends on]

1.7 Proposed solution

Explain the solution in plain language in a few paragraphs, before any detail. Say where the rule is enforced (screen, service, API), because that decides what testers check.

[Proposed solution]

2. Functional specification

2.1 Data and field mapping

Source field	Stored as	Notes
[system.object.field]	[Target field, allowed values]	[Empty or default behaviour]

2.2 Business rules

Number every rule and give one worked example. Rules written as examples get fewer questions from developers.

ID	Rule	Example
BR-01	[If ... then ... otherwise ...]	[Input values and the result]
BR-02		

2.3 States and transitions

State	Entered when	Allowed actions	Leaves to
[State]	[Event]	[Actions and who may do them]	[Next states]

2.4 Settings

Setting	Type	Default	Who can change it
[Setting name]	[yes/no, list, number, date]	[Default]	[Role]

2.5 Exception handling

Cover missing data, unknown values, failed writes and retries. For each, say what the user sees and what gets logged.

Case	System behaviour	User sees	Logged
[e.g. value not recognised]	[...]	[Message or state]	[Where, at what level]

2.6 Process flows

One diagram per flow, BPMN or a flowchart. Number the figures and refer to them by number in the text. Draw exception paths, not only the happy path.

Figure 1. [Flow name]

[Insert diagram]

2.7 UI changes

List every new or changed control. Put UI copy in *italics* so a technical writer can review it in one pass. Include empty states and error messages.

Control	Visible when	Enabled when	Values	Action
[Button, field, banner]	[Condition]	[Condition, role]	[Allowed values]	[What happens]

2.8 API

Method	Endpoint	Request	Responses
[POST]	[/resource/{id}/action]	[Body fields]	[200, 400, 403, 409 and when]

2.9 Data model changes

Table	Field	Type	Notes
[Table]	[Field]	[Type, length, nullable]	[Index, foreign key, migration]

3. Testing

3.1 Acceptance criteria

Write positive and negative criteria in Given / When / Then. Each one should trace to at least one requirement and one scenario.

AC-01, positive. [Title]

Given [starting state]

When [user or system action]

Then [observable result, including what is stored and logged]

AC-02, negative. [Title]

Given [starting state without the right or data]

When [action]

Then [refusal, message, and that nothing changed]

3.2 Automated testing

Layer	Tests	Attribute covered
[Unit]	[What is tested, with boundary values]	[Correctness]
[Integration]		[Data integrity]
[API]		[Authorisation, contract]
[Performance]		[NFR-01]

3.3 Manual testing and UAT

Test	Attribute covered
[Permission matrix walked by role]	[Authorisation]
[UAT with the business owner on a fixture set]	[Business acceptance]

Name the release gate: who signs off UAT, and on what evidence.

4. Simplifications, limitations and open questions

Simplifications

- 1. [What this version deliberately does not do, and why]

Limitations

- 1. [Known gaps users or support should know about]

Open questions

ID	Question	Owner	Due
Q1	[Question that blocks or changes a requirement]	[Name]	[Date]

Appendix A. Traceability matrix

Requirement	Scenario	Acceptance criteria	Test	Status
FR-01	[1]	[AC-01]	[Test ID]	[Not run / Pass / Fail]
FR-02				
NFR-01				

Appendix B. Glossary

Term	Meaning
[Term]	[Definition as used in this document]
